

3 Copy Mistakes

- 1 **Long copy...**
Big block of texts (even three lines) are easily skippable.
- 2 **Generic copy**
Generic copy will leave you guessing or uninterested.
- 3 **Unnecessary & duplicates**
Extra sentences and repeated information slow you down, hide what really matters, and increase the chances of confusion.

**Copy Swap Test**
Remove all logos and visuals from your screen and read the copy out loud, and ask yourself:
Could someone else use the same words on their site?

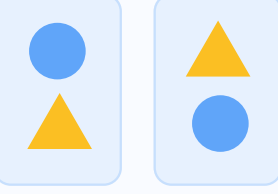

Copywriting

- 1 **Emphasize benefits**
People always have the "What's in it for me?" question in the back of their mind. The benefit has to be obvious as soon as you see something.
- 2 **Reassure**
People hesitate when they're in doubt or have unanswered questions. A simple reassurance like "You can change this later" can be enough to unblock them.
- 3 **Use specific words**
Always use clear verbs and concrete outcomes. Use active sentences that encourages the wanted behavior.
- 4 **Talk like a real person**
Read your copy out loud, if it feels off or you're naturally changing words, it's a sign.

6 Gestalt Principles

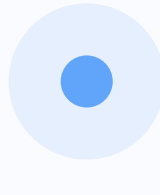

**Proximity**

**Common Region**

**Alignment**

**Similarity**

**Continuity**

**Simplicity**

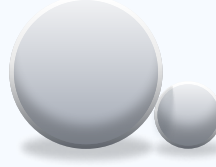

Layout

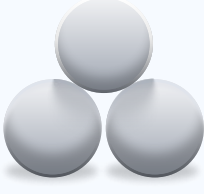

3 Layout Mistakes To Avoid

- 1. **Sloppy Spacing:**
Spacing is inconsistent or missing
Start with "too much" padding then adjust
- 2. **Border Bloat:**
Overreliance on borders
Define areas with subtle container colors
- 3. **Content Cramming**
Squeezing too much information
Remove elements (see Copywriting), use progressive disclosure

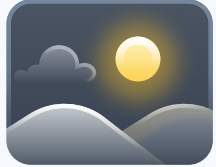

6 Emphasis Dials

**Size**

**Color**

**Placement**

**Space**

**Visualization**

**Motion**

Emphasis

Emphasis Tips and Tricks

-  **The Foggy Glasses Test**
Blurring a UI reveals its true hierarchy. By removing details, you're left with an approximation of what the brain detects first: size, contrast, position, and spacing.
-  **Common Emphasis Mistakes**
 - 1. Wrong Dial
 - 2. Weak Dial
 - 3. Screaming Dial

7 Accessibility Mistakes

Designing for everyone in a wide range of situations means trying to avoid these mistakes:

- 1. Tiny targets (easy to miss)
- 2. Crowded areas (miss click, miss tap)
- 3. Low contrast text (hard to read)
- 4. Relying on icons only (vague meaning)
- 5. Key actions hidden (no hints)
- 6. Relying on colors only for meaning
- 7. Multiple patterns (high cognitive load)
- 8. Assumptions about people's knowledge

Accessibility

**Visible without searching**
Can you see the main action without digging, scrolling, or guessing? Is it visible above the fold?

**Operable without precision**
Can you click/tap/select actions easily even if reduced in capabilities (thumb, motion, fatigue, etc.)?

**Actionable without guessing**
Do actions look like actions? Are they self-explanatory? Do I have to guess what they'll do if I activate/click/tap on them?

Reward Trifecta

**Reward Trifecta™**

**REWARDS OF Control**
Feeling safe, certain, calm and in charge

**REWARDS OF Competence**
Feeling improvement, moving forward, getting better.

**REWARDS OF Recognition**
Feeling valued by others, seen, belonging.

Reward

3 Reward Mistakes To Avoid

- 1. **Wrong Reward:**
You deliver a payoff the user doesn't care about in that moment.
- 2. **Shy Reward:**
The reward exists (time saved, status updated, recognition earned) but it's not visible enough or it's a generic praise with no real meaning, evidence, or consequence.
- 3. **Over-Reward**
The intensity or frequency of your reward is off (e.g., Giant fullscreen confetti every click for tiny actions feels spammy.)
